

IN THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

1. **(Cancelled)**
2. **(Currently Amended)** The method according to claim 1 A method of communicating between a transmitter and a receiver in a wireless multi-carrier system comprising the steps of: setting in the transmitter an initial number of carriers and an initial symbol rate at which symbols are transmitted from the transmitter to the receiver; transmitting a first group of symbols using the initial number of carriers and the initial symbol rate; changing in the transmitter the rate at which symbols are transmitted from the transmitter to the receiver from the initial symbol rate to a subsequent symbol rate that is different than the initial symbol rate; and transmitting a second group of symbols using the initial number of carriers and the subsequent symbol rate,
wherein the step of changing the rate at which symbols are transmitted includes the step of changing a frequency output by a frequency synthesizer that is used to clock a serial to parallel converter, a divide by N counter coupled to an iFFT, and a parallel to serial converter.
3. (Original) The method according to claim 2 wherein the step of changing a frequency output by a frequency synthesizer uses a phase locked loop.
4. **(Currently Amended)** The method according to claim 1 A method of communicating between a transmitter and a receiver in a wireless multi-carrier system comprising the steps of: setting in the transmitter an initial number of carriers and an initial symbol rate at which symbols are transmitted from the transmitter to the receiver;

transmitting a first group of symbols using the initial number of carriers and the initial symbol rate;
changing in the transmitter the rate at which symbols are transmitted from the transmitter to the receiver from the initial symbol rate to a subsequent symbol rate that is different than the initial symbol rate; and
transmitting a second group of symbols using the initial number of carriers and the subsequent symbol rate,

wherein the step of changing the rate at which symbols are transmitted includes the step of changing a frequency that is used to clock a serial to parallel converter, a divide by N counter coupled to an iFFT, and a parallel to serial converter by changing a multiplexer output, thereby selecting a different circuit capable of generating the subsequent symbol rate rather than a previous circuit capable of generating the initial symbol rate.

5. (Original) The method according to claim 4 wherein the step of changing the multiplexer output selects between the different circuit and the previous circuit such that the different circuit and the previous circuit respectively provide a subsequent symbol clock rate and an initial symbol clock rate using at least one of a multiplier and divider.

6-7. (Canceled)

8. (Currently Amended) The method according to claim 6 A method of communicating between a transmitter and a receiver in a wireless multi-carrier system comprising the steps of:
setting in the transmitter an initial number of carriers and an initial symbol rate at which symbols are transmitted from the transmitter to the receiver;
transmitting a first group of symbols using the initial number of carriers and the initial symbol rate;
changing in the transmitter the number of carriers in active use from the initial number of carriers to a subsequent number of carriers that is different than the initial number of carriers; and
transmitting a second group of symbols using the subsequent number of carriers,

wherein the step of changing in the transmitter the number of carriers in active use includes the step of informing the transmitter of those carriers that were used in the initial number of carriers and will not be used in the subsequent number of carriers by placing zero magnitude signals on those carriers within the transmitter.

9. (Currently Amended) The method according to claim 6 A method of communicating between a transmitter and a receiver in a wireless multi-carrier system comprising the steps of: setting in the transmitter an initial number of carriers and an initial symbol rate at which symbols are transmitted from the transmitter to the receiver; transmitting a first group of symbols using the initial number of carriers and the initial symbol rate; changing in the transmitter the number of carriers in active use from the initial number of carriers to a subsequent number of carriers that is different than the initial number of carriers; and transmitting a second group of symbols using the subsequent number of carriers, wherein the step of changing in the transmitter the number of carriers in active use includes the step of informing the transmitter of those carriers that were not used in the initial number of carriers and will be used in the subsequent number of carriers by placing data conveying signals into those carriers that previously had zero magnitude signals within the transmitter.

10-11. (Canceled)

12. (Currently Amended) The method according to claim 11 A method of communicating between a transmitter and a receiver in a wireless multi-carrier system comprising the steps of: setting in the transmitter an initial number of carriers and an initial symbol rate at which symbols are transmitted from the transmitter to the receiver; transmitting a first group of symbols using the initial number of carriers and the initial symbol rate;

William McFarland
Serial No. 09/839,565
60412291v1

changing in the transmitter the number of carriers in active use from the initial number of carriers to a subsequent number of carriers that is different than the initial number of carriers; and

transmitting a second group of symbols using the subsequent number of carriers,
wherein the step of changing in the transmitter the number of carriers in active use
includes the step of changing an iFFT size of an iFFT in the transmitter by a factor
that is a power of two, and

wherein the step of changing in the transmitter the number of carriers in active use further includes the step of informing the transmitter of those carriers that were used in the initial number of carriers and will not be used in the subsequent number of carriers by placing zero magnitude signals on those carriers within the transmitter.

13. (Currently Amended) The method according to claim 11 A method of communicating between a transmitter and a receiver in a wireless multi-carrier system comprising the steps of:
setting in the transmitter an initial number of carriers and an initial symbol rate at which
symbols are transmitted from the transmitter to the receiver;
transmitting a first group of symbols using the initial number of carriers and the initial
symbol rate;
changing in the transmitter the number of carriers in active use from the initial number of
carriers to a subsequent number of carriers that is different than the initial number of
carriers; and
transmitting a second group of symbols using the subsequent number of carriers,
wherein the step of changing in the transmitter the number of carriers in active use
includes the step of changing an iFFT size of an iFFT in the transmitter by a factor
that is a power of two, and
wherein the step of changing in the transmitter the number of carriers in active use further includes the step of informing the transmitter of those carriers that were not used in the initial number of carriers and will be used in the subsequent number of carriers by placing data conveying signals into those carriers that previously had zero magnitude signals within the transmitter.

14. (Canceled)

15. (Currently Amended) The method according to claim 14 A method of communicating between a transmitter and a receiver in a wireless multi-carrier system comprising the steps of: setting in the transmitter an initial number of carriers and an initial symbol rate at which symbols are transmitted from the transmitter to the receiver; transmitting a first group of symbols using the initial number of carriers and the initial symbol rate; changing in the transmitter the rate at which symbols are transmitted from the transmitter to the receiver from the initial symbol rate to a subsequent symbol rate that is different than the initial symbol rate; changing in the transmitter the number of carriers in active use from the initial number of carriers to a subsequent number of carriers that is different than the initial number of carriers; and transmitting a second group of symbols using the subsequent number of carriers and the subsequent symbol rate,
wherein the step of changing the rate at which symbols are transmitted includes the step of changing a frequency output by a frequency synthesizer that is used to clock a serial to parallel converter, a divide by N counter coupled to an iFFT, and a parallel to serial converter.

16. (Original) The method according to claim 15 wherein the step of changing a frequency output by a frequency synthesizer uses a phase locked loop.

17. (Currently Amended) The method according to claim 14 A method of communicating between a transmitter and a receiver in a wireless multi-carrier system comprising the steps of: setting in the transmitter an initial number of carriers and an initial symbol rate at which symbols are transmitted from the transmitter to the receiver; transmitting a first group of symbols using the initial number of carriers and the initial symbol rate;

changing in the transmitter the rate at which symbols are transmitted from the transmitter to the receiver from the initial symbol rate to a subsequent symbol rate that is different than the initial symbol rate;

changing in the transmitter the number or carriers in active use from the initial number of carriers to a subsequent number of carriers that is different than the initial number of carriers; and

transmitting a second group of symbols using the subsequent number of carriers and the subsequent symbol rate,

wherein the step of changing the rate at which symbols are transmitted includes the step of changing a frequency that is used to clock a serial to parallel converter, a divide by N counter coupled to an iFFT, and a parallel to serial converter by changing a multiplexer output, thereby selecting a different circuit capable of generating the subsequent symbol rate rather than a previous circuit capable of generating the initial symbol rate.

18. (Original) The method according to claim 17 wherein the step of changing the multiplexer output selects between the different circuit and the previous circuit such that the different circuit and the previous circuit respectively provide a subsequent symbol clock rate and an initial symbol clock rate using at least one of a multiplier and divider.

19. (Cancelled)

20. (Currently Amended) The method according to claim 14 A method of communicating between a transmitter and a receiver in a wireless multi-carrier system comprising the steps of:
setting in the transmitter an initial number of carriers and an initial symbol rate at which symbols are transmitted from the transmitter to the receiver;
transmitting a first group of symbols using the initial number of carriers and the initial symbol rate;
changing in the transmitter the rate at which symbols are transmitted from the transmitter to the receiver from the initial symbol rate to a subsequent symbol rate that is different than the initial symbol rate;

changing in the transmitter the number or carriers in active use from the initial number of carriers to a subsequent number of carriers that is different than the initial number of carriers; and

transmitting a second group of symbols using the subsequent number of carriers and the subsequent symbol rate,

wherein the step of changing in the transmitter the number of carriers in active use includes the step of informing the transmitter of those carriers that were used in the initial number of carriers and will not be used in the subsequent number of carriers by placing zero magnitude signals on those carriers within the transmitter.

21. **(Currently Amended)** The method according to claim 14 A method of communicating between a transmitter and a receiver in a wireless multi-carrier system comprising the steps of:
setting in the transmitter an initial number of carriers and an initial symbol rate at which symbols are transmitted from the transmitter to the receiver;
transmitting a first group of symbols using the initial number of carriers and the initial symbol rate;
changing in the transmitter the rate at which symbols are transmitted from the transmitter to the receiver from the initial symbol rate to a subsequent symbol rate that is different than the initial symbol rate;
changing in the transmitter the number or carriers in active use from the initial number of carriers to a subsequent number of carriers that is different than the initial number of carriers; and
transmitting a second group of symbols using the subsequent number of carriers and the subsequent symbol rate,

wherein the step of changing in the transmitter the number of carriers in active use includes the step of informing the transmitter of those carriers that were not used in the initial number of carriers and will be used in the subsequent number of carriers by placing data conveying signals into those carriers that previously had zero magnitude signals within the transmitter.

22-23. (Canceled)

24. (Currently Amended) The method according to claim 23 A method of communicating between a transmitter and a receiver in a wireless multi-carrier system comprising the steps of: setting in the transmitter an initial number of carriers and an initial symbol rate at which symbols are transmitted from the transmitter to the receiver; transmitting a first group of symbols using the initial number of carriers and the initial symbol rate; changing in the transmitter the rate at which symbols are transmitted from the transmitter to the receiver from the initial symbol rate to a subsequent symbol rate that is different than the initial symbol rate; changing in the transmitter the number of carriers in active use from the initial number of carriers to a subsequent number of carriers that is different than the initial number of carriers; and transmitting a second group of symbols using the subsequent number of carriers and the subsequent symbol rate, wherein the step of changing in the transmitter the number of carriers in active use includes the step of changing an iFFT size of an iFFT in the transmitter by a factor that is a power of two, and
wherein the step of changing in the transmitter the number of carriers in active use further includes the step of informing the transmitter of those carriers that were used in the initial number of carriers and will not be used in the subsequent number of carriers by placing zero magnitude signals on those carriers within the transmitter.

25. (Currently Amended) The method according to claim 23 A method of communicating between a transmitter and a receiver in a wireless multi-carrier system comprising the steps of: setting in the transmitter an initial number of carriers and an initial symbol rate at which symbols are transmitted from the transmitter to the receiver; transmitting a first group of symbols using the initial number of carriers and the initial symbol rate;

William McFarland
Serial No. 09/839,565
60412291v1

changing in the transmitter the rate at which symbols are transmitted from the transmitter to the receiver from the initial symbol rate to a subsequent symbol rate that is different than the initial symbol rate;

changing in the transmitter the number of carriers in active use from the initial number of carriers to a subsequent number of carriers that is different than the initial number of carriers; and

transmitting a second group of symbols using the subsequent number of carriers and the subsequent symbol rate,

wherein the step of changing in the transmitter the number of carriers in active use includes the step of changing an iFFT size of an iFFT in the transmitter by a factor that is a power of two, and

wherein the step of changing in the transmitter the number of carriers in active use further includes the step of informing the transmitter of those carriers that were not used in the initial number of carriers and will be used in the subsequent number of carriers by placing data conveying signals into those carriers that previously had zero magnitude signals within the transmitter.

26-78. (Canceled)

79. (Canceled)

80. (Currently Amended) The method according to claim 79 A method of communicating from a first transceiver in a wireless multi-carrier system comprising the steps of:

transmitting from the first transceiver a group of symbols using a first particular number of carriers and a first particular symbol rate during a first period of time; and
transmitting from the first transceiver another group of symbols using a second particular number of carriers and a second particular symbol rate during a subsequent period of time, wherein at least one of the second particular number of carriers and the second particular symbol rate is different than the first particular number of carriers and the first particular symbol rate,

wherein the second particular number of carriers and the second particular symbol rate are identified in a header portion of the group of symbols transmitted at the first particular number of carriers and the first particular symbol rate; and further including the step configuring the first transceiver to transmit the another group of symbols using the second particular number of carriers and the second particular symbol rate identified in the header portion of the group of symbols transmitted at the first particular number of carriers and the first particular symbol rate.

81. (Original) The method according to claim 80 wherein:
both the second particular number of carriers and the second particular symbol rate are different than the first particular number of carriers and the first particular symbol rate.

82. (Original) The method according to claim 81 wherein the second particular number of carriers is greater than the first particular number of carriers and the second particular symbol rate is greater than the first particular symbol rate.

83-92. (Canceled)
